Faizan Yousufzai

REPORT TYPE

Full SEO Audit

STATUS

Sample / Demo Data

Executive Summary

This sample audit shows how to turn SEO findings into a clear plan. The demo website has a solid foundation, but several technical and content issues could reduce crawl efficiency, page experience and organic visibility.

Overall assessment: Fix indexability and redirect issues first, then improve high-value pages, internal linking and Core Web Vitals. The numbers below are sample data for demonstration only.

72	81	64	58
SEO Health	Indexability	Content	Performance

Key Findings

High	12 important URLs are not indexable	Search engines may miss valuable pages	Review noindex, canonical and robots directives
High	19 redirect chains detected	Wasted crawl time and slower user journeys	Replace multi-hop redirects with one direct 301
Medium	23 pages have weak or duplicate title tags	Lower relevance and weaker click-through potential	Rewrite titles around intent and page topic
Medium	Mobile LCP is above target on key templates	Slower perceived loading experience	Compress hero media and reduce render-blocking work
Low	34 images have missing or weak alt text	Accessibility and image context can improve	Add useful descriptive alt text where appropriate

Recommended sequence: Indexability and crawl controls -> redirects and status codes -> important page optimization -> internal linking -> speed improvements -> authority growth.

Technical SEO Audit

Technical SEO checks whether search engines can crawl, render and index the right pages without unnecessary barriers.

Crawl & Indexability

Robots.txt	Review	One ruleset blocks a resource folder used by a page template	Confirm that required CSS/JS resources remain crawlable
XML Sitemap	Needs work	7 redirected URLs and 4 non-canonical URLs are listed	Keep only canonical, indexable 200-status URLs
Canonical Tags	Needs work	6 pages point to an unrelated canonical	Map each page to the correct preferred URL
Status Codes	Needs work	11 broken internal URLs return 404	Update internal links or restore the intended pages
Redirects	Needs work	19 redirect chains contain 2 or more hops	Link directly to the final destination
HTTPS	Good	No mixed-content issue found in the sample	Continue monitoring after releases

Technical Priority Notes

High: Anything that prevents an important page from being indexed or sends crawlers to the wrong URL should be handled first.

Medium: Redirect chains, duplicate metadata and inefficient architecture may not block indexing, but they can reduce clarity and waste crawl activity.

Low: Small cleanup items should be grouped into development or content maintenance work after the larger blockers are fixed.

Example validation checklist

☐	Important pages return 200 status
☐	Canonical tags point to the intended preferred URLs
☐	XML sitemap contains only indexable canonical URLs
☐	No important page is blocked by robots.txt or noindex
☐	Internal links do not pass through redirect chains
☐	404s and soft-404s are reviewed and resolved

On-Page SEO & Content

A page can be technically crawlable and still underperform if its search intent, topic coverage or internal linking is weak.

On-Page Review

Title tags	23 need improvement	Duplicate, vague or overly long titles can reduce relevance and click appeal
H1 headings	9 need review	Several pages use generic headings that do not clearly describe the page
Meta descriptions	31 missing or duplicated	Not a direct ranking factor, but useful for clearer search snippets
Thin content	14 pages flagged	Pages may not fully answer the search intent or add enough unique value
Internal links	17 orphan/underlinked pages	Important pages need stronger connections from relevant content
Cannibalization	3 topic clusters overlap	Multiple pages may be targeting almost the same intent

Content Quality Framework

1. Match the intent. A guide should answer the question quickly. A service page should explain the service, proof, process and next step.
2. Cover the topic fully. Add useful subtopics, entities, examples and common questions instead of repeating one keyword.
3. Show evidence. Screenshots, original observations, examples, author details and sources make content more trustworthy and easier to verify.
4. Build topical connections. Link related blogs to each other and connect relevant informational content with the matching service page.

Sample Content Improvement

Before	After
H1: SEO Services Intro: We offer SEO services for businesses.	H1: Technical SEO Audit & Growth Roadmap Intro: Clear explanation of the problem, process, expected outputs and who the service is for.

Page Experience & Core Web Vitals

Performance work should focus on real user experience, especially key landing pages and mobile templates. The values below are example lab or field-style metrics, not measurements from a live website.

Sample Performance Snapshot

LCP	3.8 s	2.1 s	<= 2.5 s	Needs work
INP	260 ms	145 ms	<= 200 ms	Needs work
CLS	0.07	0.04	<= 0.10	Good
TTFB	1.1 s	0.6 s	Lower is better	Review

Likely Optimization Opportunities

Compress and resize hero images	Reduces bytes required before main content can appear	High
Preload the critical hero asset	Can improve the loading path for the largest visible element	High
Reduce unused JavaScript	Less work on the main thread can improve responsiveness	Medium
Use better font loading	Avoids unnecessary blocking and layout shifts	Medium
Review third-party scripts	Analytics, chat and widgets can create extra network/main-thread work	Medium

Reporting tip: Do not present a speed score alone. Show the affected template, the important metric, the likely cause, and the recommended fix.

Backlinks & Authority

Off-page analysis reviews the quality and relevance of links pointing to the site. A strong report separates useful opportunities from raw link counts.

Sample Backlink Snapshot

Referring domains	146	Moderate base; growth should focus on relevant sites
Follow links	68%	Healthy mix can vary by site and niche
Lost domains (90 days)	12	Review important lost links and restore where useful
Broken backlink targets	9 URLs	Redirect to the best relevant live page when appropriate
Topical relevance	Mixed	Some links come from unrelated directories with low strategic value

Authority Growth Opportunities

Recover: Fix or redirect URLs that have earned useful backlinks but now return errors.

Strengthen: Add internal links toward pages that already attract external authority but do not pass enough value deeper into the site.

Create: Publish original resources that people have a reason to reference, such as research, calculators, templates, studies, checklists or useful tools.

Promote: Reach relevant publishers and communities where the resource genuinely adds value.

What Not to Prioritize

Avoid making decisions only from a domain score, total backlink count or a large list of low-quality directory links. The audit should focus on relevance, quality, context and the pages that need authority most.

90-Day SEO Action Plan

A good audit ends with a prioritized plan. This example groups work by impact and dependency instead of trying to fix every issue at once.

Phase 1 - Fix Critical Access Issues (Days 1-14)

Resolve indexability blockers on key pages	SEO + Developer	High
Clean sitemap and canonical errors	SEO + Developer	High
Fix broken internal links and redirect chains	Developer	High

Phase 2 - Improve Important Pages (Days 15-45)

Rewrite weak titles, H1s and introductions	SEO / Content	High
Strengthen internal links across topic clusters	SEO	High
Improve thin pages and resolve cannibalization	SEO / Content	Medium

Phase 3 - Grow Performance & Authority (Days 46-90)

Improve LCP and JavaScript performance on key templates	Developer	Medium
Recover broken high-value backlinks	SEO	Medium
Publish 2-3 link-worthy resources around priority topics	SEO / Content	Medium

Success Metrics

Track progress with a small set of outcomes: indexable priority pages, non-branded organic clicks, ranking coverage for target topics, Core Web Vitals on important templates, conversions from organic traffic, and quality referring domains.

Sample report note

This document is a sample layout. A real SEO audit should use verified crawl data, Search Console, analytics, performance measurements, backlink data and manual page review before recommendations are finalized.
